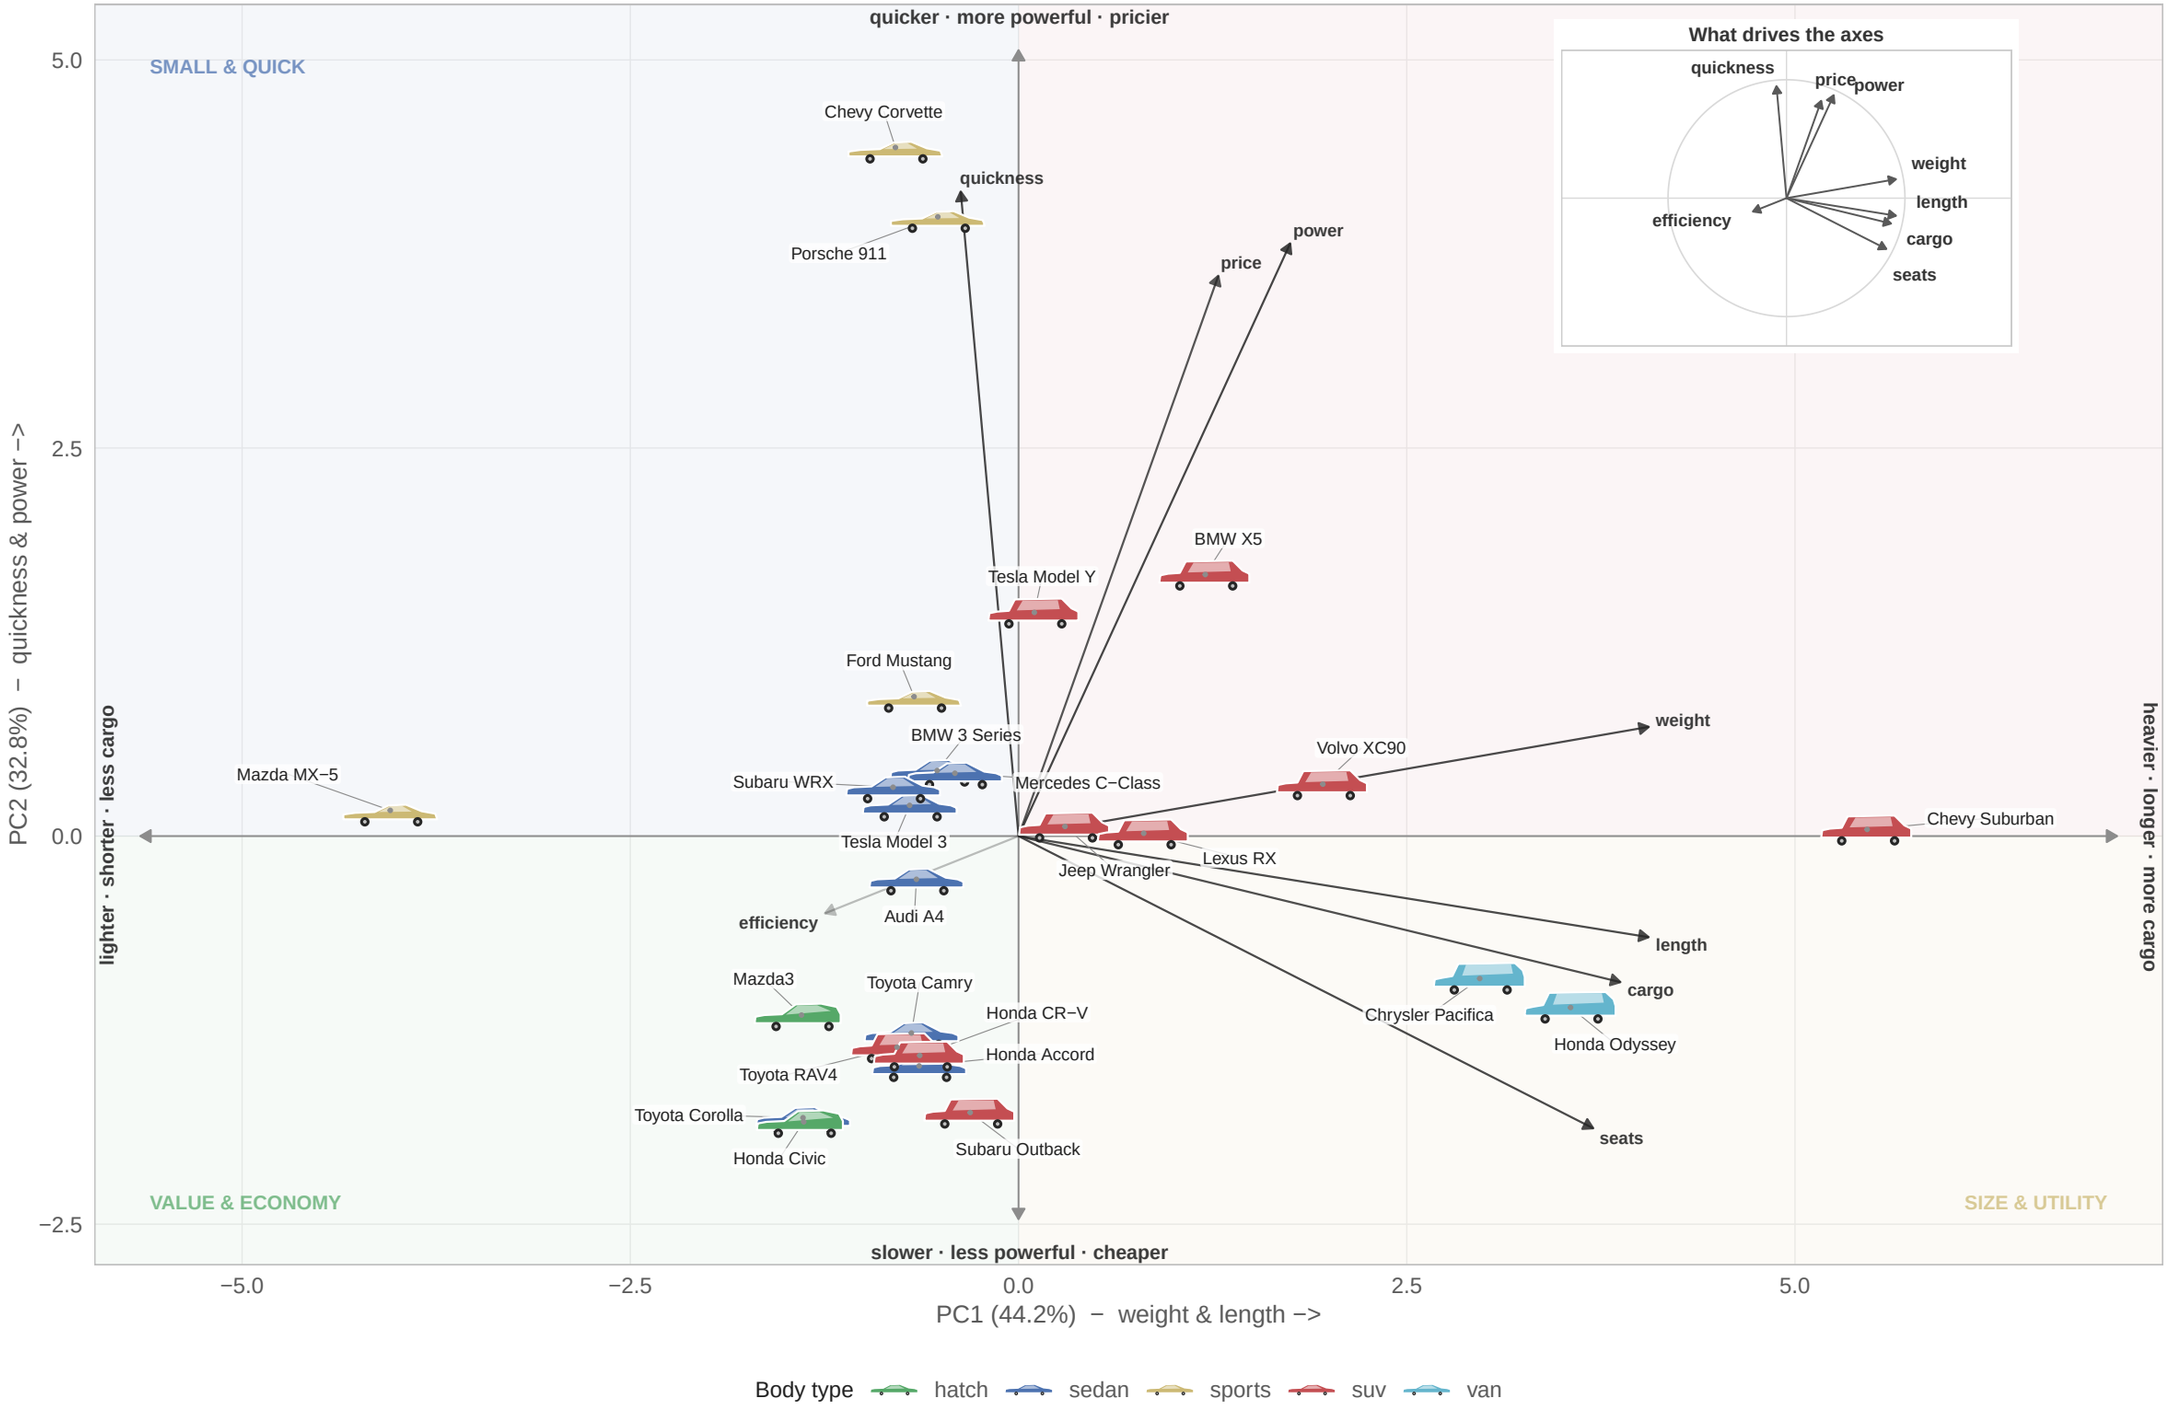
Perceptual Map of the Car Market

PCA on 8 attributes − 25 models, 77.0% of variance on these two axes



PC = principal component: an axis that blends all 8 specs into one score per car. The % is how much of the difference between cars that axis captures.
PC1 (44.2%) is mostly size: further right = heavier, longer, more cargo. PC2 (32.8%) is mostly performance: higher up = quicker, more powerful, pricier.
Arrows are the attributes, pointing the way that spec rises; compare arrows with each other, not with the cars.
Silhouettes are drawn in R. Specs are approximate, curated for illustration.
